MARKED-UP PARAGRAPH 1 ON PAGE 9 OF THE SPECIFICATION

--In the embodiment according to Figure 5, the back section is composed of a plate 31 and the front section of a plate 32 interconnected to a base plate 33. The front section 32 and the back section 31 correspond as regards to their shape and function, respectively to the front and back sections according to Figs. 1-4. The back section 31 has a recess 4 into which a protruding element 35 of the front section is to be accommodated. The plate 31 is articulated on an axis 10 situated at the base of the back section, parallel to the lower plane of the device and perpendicular to the bisectrix of the angle defined by the sides 8 and 9. The plate 31 is interconnected to a lever 11 which enables it to toggle away from the front section 32 when the user depresses the lever 11 in order to facilitate the insertion of the sheet 3. While the user depresses the lever 11, the plate 31 and the front section 32 form, temporarily, a space corresponding to the space 13 of the device according to Figures 1 to 4. A spring 12 tends to push the back section 1 against the front section 32 with sufficient pressure to force the sheet 3 to hug the shapes of the front and back sections.--
